

## Results from variation partitioning for functional dispersion based on different niche axes.

Table S7. For each combination of season and scale, adjusted  $R^2$  of the model with both sets of predictor variables [abc], the model with environmental variables [ab], the model with the spatial variable [bc] and the four fractions ([a], [b], [c], and [d]) for functional dispersion ( $s_F$ ) based on different functional niche axes. Fractions [a] and [c] are the unique contributions of environment and space, respectively. Fraction [b] is the shared contributions of environmental and spatial predictors, and fraction [d] is the residual variation. Testable model fractions (i.e. unique contributions) that were significant are indicated by superscript symbols ( $^\circ$ ,  $0.10 \geq P > 0.05$ ;  $^*$ ,  $P \leq 0.05$ ).
