

Multi-omic profiling to assess the effect of iron starvation in *Streptococcus pneumoniae*

TIGR4

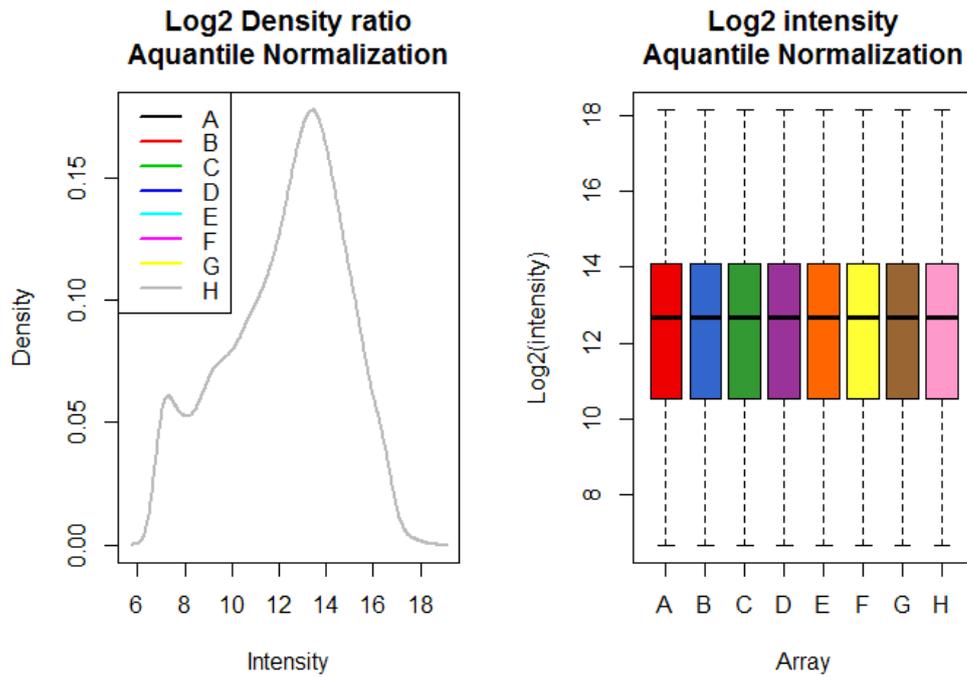

Fig. S1. Normalized data of the DNA microarray. Left panel: Density of intensity signal graph after normalization. Right panel: Intensity graph after normalization. This included two steps: a within and a between normalization with the Limma package as described in Material and Methods.

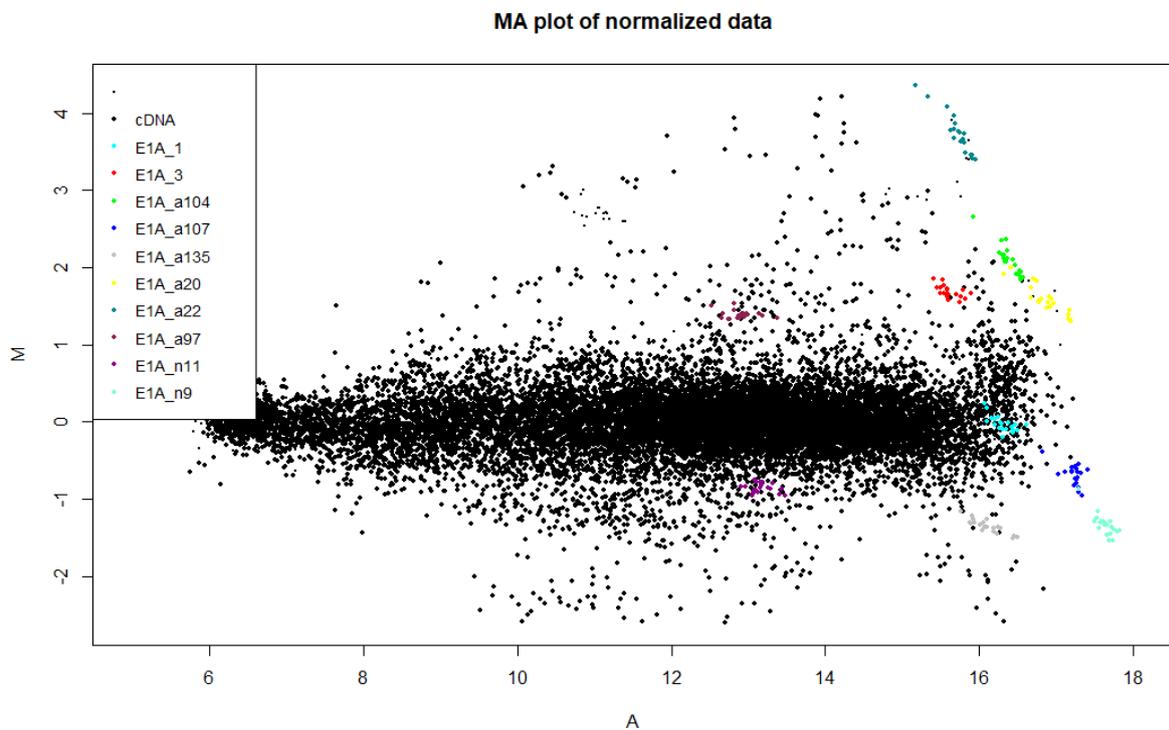

Fig. S2. MA plot of normalized data. Data obtained from microarrays were background subtracted, then normalized according the within-loess and the between-aquantile, and finally was averaged. The black spots correspond to cDNA. The color spots are the Spike-in controls used in the microarray.

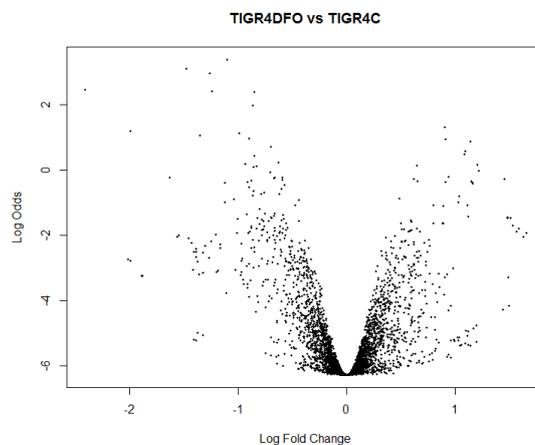

Fig. S3. Volcano plot corresponding to the differentially expressed genes in *Streptococcus pneumoniae* TIGR4 subject to iron starvation after deferoxamine (DFO) treatment.

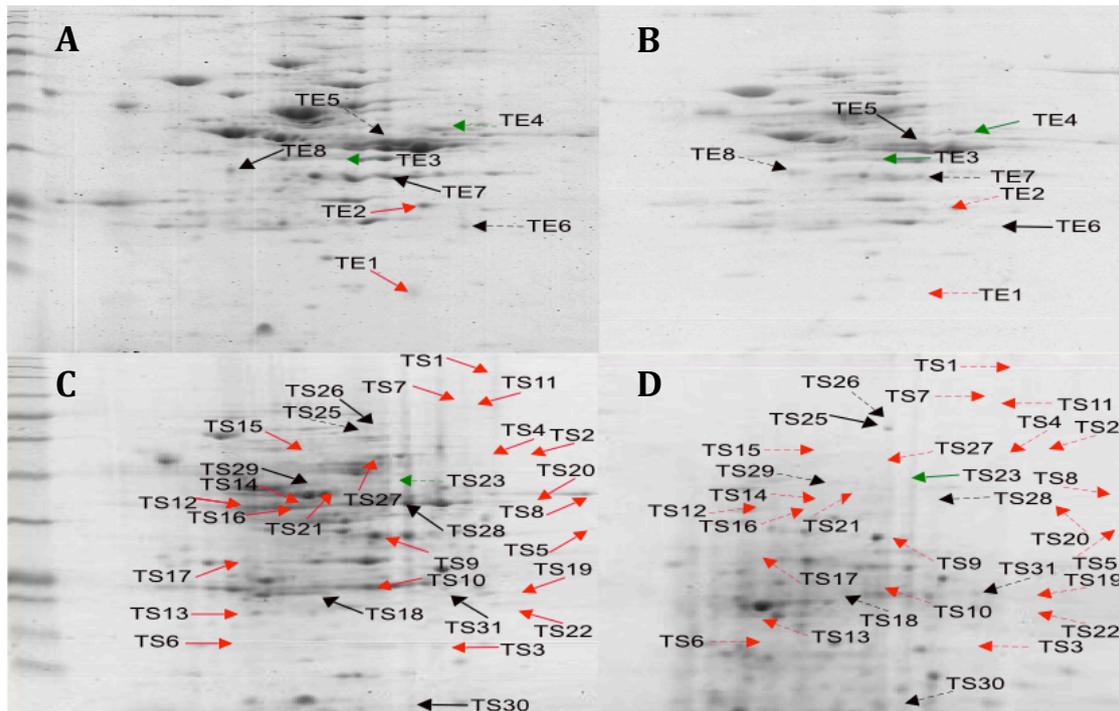

Fig. S4. 2-DE protein profiles of *Streptococcus pneumoniae* TIGR4. A) Control total extract; B) deferoxamine (DFO)-treated total extract; C) control secretome; and D) DFO-treated secretome. Differential proteins are indicated by arrows: Red, spots absent in the DFO-treated samples; Green, spots only present in the DFO-treated samples; and Black, proteins present in both control and treatments, but with increased abundance (>2 fold-change, solid line) or with decreased abundance (<0.5 fold-change, dotted line) in the DFO-treated samples compared to the control.

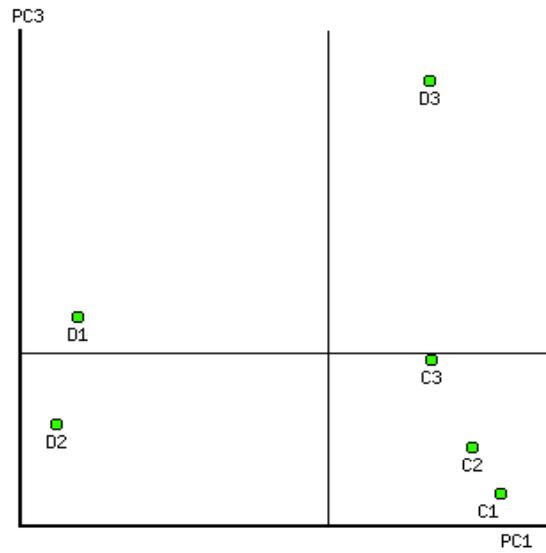

Fig. S5. Principal component analysis plot of differentially abundant metabolites in *Streptococcus pneumoniae* TIGR4. Dots C1-C3 represent the three biological replicates of the control and D1-D3 the three biological replicates of the deferoxamine (DFO) treatment.

Table S1. Microarray validation by RT-qPCR

Locus	Log ₂ FC	
	RT-qPCR	Microarray

Log2 fold changes (FC) are the ratio between deferomaxamine treatment and control. Positive values indicate up-regulation, and negative values indicate down-regulation
