

**Table A2: Statistical results for proportion of juveniles in patch 1 versus patch 2.** Test results for differences in the proportion of *D. carinata* juveniles in patch 1 and 2 after 96 hours. A generalised linear model was used with parameter estimates on the logit scale and binomial errors. No effect of patch was found ( $P = 0.331$ ), suggesting that juveniles were not over-represented amongst dispersers.

Parameter	Estimate (SE)	$z$ stat	$P$ value
<i>Intercept</i>	-0.215 (0.103)	2.068	<0.05
<i>Patch</i>	0.0865 (0.0889)	0.872	0.331
