

Figure S-2- Years of Adoption of Adaptive Multi-Paddock (AMP) grazing management compared to standing crop biomass. Figure a) depicts all five AMP farms number of years of adoption and their moderate direct correlation with standing crop biomass ($R^2= 0.2782$; $p= 0.361$). Figure b) relays the linear regression analysis ($R^2= 0.9194$; $p= 0.04$) with the removal of AMP-5 to demonstrate a strong direct relationship indicating the longer AMP practices are employed, the greater the production of standing crop biomass.
