

Supplementary File 2: Representative photos of the snails collected from each family. All snails are shown in the wells of a 12- or 24-well cell culture plate. Snail families are as follows: Top Left: Hydrobiidae; Top Right: Lymnaidae (some lymnaid snails we collected looked more like the pictured physid); Middle Left: Physidae; Middle Right: Planorbidae (some planorbid snails we collected were significantly larger than the one shown); Bottom Left: Valvatidae; Bottom Right: Viviparidae (most collected viviparid snails were too large to fit in the cell culture plate wells and looked more like the inset photo; the main photo is of a very young snail).
