

# Appendix 1

Jacob C. Cooper

2024-02-27

Concatenated here are all additional figures. Please note that some figures are missing, as the code is written to ‘skip’ figures that are identity plots or repeated plots. All unique and relevant figures are shown.

Running the NicheEvol program in progne.

```
filepath="~/Dropbox/Manuscripts/Progne/"
```

### C: NichEvol Data Preparation

```
library(geiger)
library(nichevol)
library(raster)
library(tidyverse)
library(data.table)
library(nodiv)

# load rformat_type
library(ellipsenm)

# test with one
precip=raster(paste0(GISpath,"current_2-5arcmin_annualPET.tif"))

m_files=list.files(paste0(filepath,"Ms/"),pattern="*accessible.gpkg")

occ_list=read_csv(paste0(filepath,"progne_env_extract.csv"))
```

```

p.tree=read.tree(paste0(filepath,"Sequences/all-v2-samples-95-best.raxml.bestTree"))

# fix tree
fnames=p.tree$tip.label

# reduce to Progne
fnames_index=which(!fnames%like%"Prgne")

p.tree2=drop.tip(p.tree,fnames_index)

# plot of all Progne
plot.phylo(p.tree2,cex=0.65,main="Figure C.1: All Progne")

```

**Figure C.1: All Progne**

This tree is from Clare Brown's dissertation, as made available by Subir Shakya (with thanks also to Fred Sheldon). From Clare Brown's dissertation, we know that *chalybea* is monophyletic, and that it is not sister to *elegans*. We want to reduce this to a single individual per species for our next analyses.

```

keepers=c("Progne_tapera_tapera_Peru_LSUMNS_75925",
         "Progne_chalybea_Central_America_Panama_LSUMNS_28811",
         "Progne_sinaloae_Mexico_KU_40044",
         "Progne_dominicensis_Dominican_Republic_LSUMNS_22019",
         # "AY825945.1-Progne_cryptoleuca", # not included in phylo
         "Progne_elegans_Argentina_KU_124008",
         "Progne_subis_USA_LSUMNS_41548",
         "Progne_murphyi_Peru_LSUMZ_114185"),
         # "MH307578.1-Progne_modesta") # not included in phylo

p.tree3=drop.tip(p.tree2,c(which(p.tree2$tip.label%in%keepers==F)))
plot(p.tree3,main='Figure C.3')

```

## Figure C.3

- *Progne murphyi* Peru LSUMZ 114185
- *Progne chalybea* Central America Panama LSUMNS 28811
- *Progne sinaloae* Mexico KU 40044
- *Progne dominicensis* Dominican Republic LSUMNS 22019
- *Progne elegans* Argentina KU 124008
- *Progne subis* USA LSUMNS 41548
- *Progne tapera tapera* Peru LSUMNS 75925

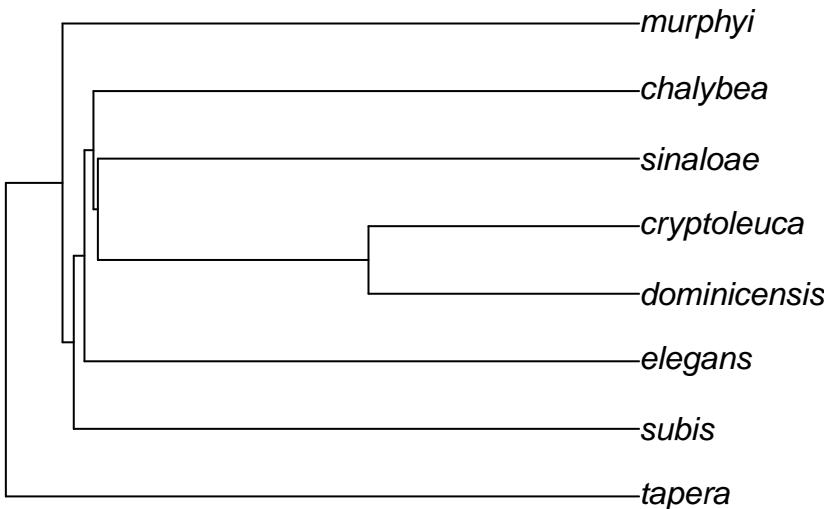

While not included in this dataset, we can also place some species from Moyle et al. (2008), and use these estimates to help in the reconstruction.

1. *P. cryptoleuca* is sister to *P. dominicensis*.
  2. There is no molecular evidence for the placement of *P. modesta*.

```
write.tree(phy_tree,file=paste0(filepath,"new_tree.tre"))
```

### Added taxon in file

```
phy_tree=read.tree(file=paste0(filepath,"new_tree2.tre"))
plot(phy_tree)
```

#### D: Occurrences and Environmental Data

We need to split occurrences into separate files, and put them in a separate folder.

```
# split occ_list into files named the same as the tips

spp=unique(occ_list$Species)

for(i in 1:length(spp)){
  sp=spp[i]
  occ_list%>%
    filter(Species==sp)%>%
    write_csv(file=paste0(filepath,"occ_dir/",
                          gsub(" ","_",sp),".csv"))
}
```

There is an error in the code. I removed it and then it was able to run. Specifically, in line 86, I removed reference to the “species” corresponding to that iteration. Note also that the files in each have to be an exact match.

```
source(paste0(filepath,'stats_evals2.r'))

stats_evals2(stats=c("mean","median","sd","range"),
             M_folder=paste0(filepath,"Ms/name_species_tree/"),M_format="gpkg",
             occ_folder=paste0(filepath,"occ_dir/"),
             longitude = "Long",latitude = "Lat",
             var_folder=GIS,var_format="GTiff", # must specify GTiff
             save=T,output_directory = paste0(filepath,"nichevol/"),
             overwrite = T)
```

Testing the next section with annual PET.

```
# load both files for annualPET
progne.stats=
  read_csv(paste0(filepath,
                  "nichevol/current_2.5arcmin_annualPET_M_stats.csv"))%>%
  filter(Species!="Progne modesta.gpkg")
m.stats=
```

```

read_csv(paste0(filepath,
                 "nichevol/current_2.5arcmin_annualPET_Occurrence_stats.csv"))%>%
filter(Species!="Progne modesta.gpkg")

```

These values may vary, as the document renders them each time. Set seed should fix this, see beginning of document; `set.seed(2024)`.

```

bins=bintables_jc(M_folder=paste0(filepath,"Ms/name_species_tree/"),
                  M_format="gpkg",occ_folder=paste0(filepath,"occ_dir/"),
                  longitude = "Long",latitude = "Lat",
                  percentage_out = 0,bin_size = 10,
                  var_folder=GIS,var_format="GTiff") # must specify GTiff

```

Link the tree to the data, and then iteratively perform the reconstructions.

```

### loop through and create tree projects

phy_tree2=phy_tree
