

Supplemental Figure 15. Postural changes of VO among male participants during Test 2 (n = 16). The graphs show data from 4 REG leads: left and right fronto-mastoid (FM), left and right occipito-mastoid (OM) for sitting and supine positions. The graphs show confidence intervals with means represented by circle-shaped points, and medians depicted as rhomb-shaped points. Additionally, points and intervals are highlighted by different colors to distinguish between first sitting (oSA) and supine (oHA) positions and second sitting (oSB) and supine (oHB) positions. A one-way repeated measures ANOVA summary for statistically significant results: left FM ($F(1.697, 25.46) = 16.03, p < 0.0001$), right FM ($F(3, 45) = 4.812, p = 0.0054$), left OM ($F(2.073, 31.10) = 9.858, p = 0.0004$). “*” – $p < 0.05$, “**” – $p < 0.01$, “***” – $p < 0.001$.
