

Supplemental Figure 28. Postural changes of CT among male participants during Test 2 (n = 16). The graphs show data from 4 REG leads: left and right fronto-mastoid (FM), left and right occipito-mastoid (OM) for sitting and supine positions. The graphs show confidence intervals with means represented by circle-shaped points. Additionally, points and intervals are highlighted by different colors to distinguish between first sitting (oSA) and supine (oHA) positions and second sitting (oSB) and supine (oHB) positions. A one-way repeated measures ANOVA summary for statistically significant results: left FM ($F(1.634, 24.51) = 62.31, p < 0.0001$), right FM ($F(1.582, 23.73) = 54.73, p < 0.0001$), left OM ($F(1.804, 27.06) = 33.33, p < 0.0001$), right OM ($F(1.446, 21.69) = 36.55, p < 0.0001$). “*” – $p < 0.05$, “***” – $p < 0.001$, “****” – $p < 0.0001$.
