

Supplemental Figure 56. Sex differences in alpha spectral power (P_{α}) for F7, F8, T3, T4, T5 and T6 electrodes during first (HA) and last (HB) 2 minutes of supine position in Test 1 ($n = 35$). Black boxplots include values of male participants (m), and red boxplots contain values of female participants (f). Pairs of boxplots were analyzed separately, i.e., HA (m) was compared only to HA (f), and HB (m) was compared only to HB (f). Outliers are shown by black and blue points. A one-way ANOVA and a nonparametric Kruskal-Wallis test summaries for statistically significant results: F7 ($F(3, 66) = 4.9, p = 0.0039$), F8 (Kruskal-Wallis statistic = 11.77, $p = 0.0082$), T3 (Kruskal-Wallis statistic = 9.926, $p = 0.0192$), T4 (Kruskal-Wallis statistic = 11.25, $p = 0.0104$), T6 (Kruskal-Wallis statistic = 14.87, $p = 0.0019$) “*” – $p < 0.05$, “**” – $p < 0.01$.
