

Supplemental Figure 9. Sex differences in RWA during supine positions in Test 1 ($n = 37$).

The graphs show data from 4 REG leads: left and right fronto-mastoid (FM), left and right occipito-mastoid (OM) for the first and last 2 minutes of supine position (HA and HB). Black boxplots include values of male participants (m), and red boxplots contain values of female participants (f). Pairs of boxplots were analyzed separately using one-way ANOVA, i.e., HA (m) was compared only to HA (f), and HB (m) was compared only to HB (f). Outliers are shown by black and blue points. A one-way ANOVA test summary for statistically significant results: right FM ($F(3, 70) = 3.595, p = 0.0177$). “*” – $p < 0.05$.
