

Profiling of effects sizes against set values for the effect of Catch on SSB. Each panel refers to a single causal effect and shows the estimated effect size (plain black line) and the 95% confidence limits against values of the effect of Catch on SSB ranging from -1 (full effect = one tonne caught leads to one tonne less in the SSB the following year) to zero (no effect of catch on SSB). The absence of effect is indicated by a red dashed line centered on zero (y-axis).
